throughout the literature from the methodology  
point of view. It reviews the basic theories and  
methods, with many interesting problems in  
partial and ordinary differential equations,  
differential geometry and mathematical physics as  
applications, and provides the necessary  
preparation for almost all important aspects in  
contemporary studies. All methods are illustrated  
by carefully chosen examples from mechanics,  
physics, engineering and geometry.

**Jayne Mansfield** Jocelyn Faris 1994-11-30 People  
today remember Jayne Mansfield as a famous  
Hollywood movie star. However, she starred in  
only three American movies before moving to low-  
budget European films. She was a master of  
publicity who appeared in newspapers across the  
nation almost daily. The media focused on her  
figure and her stormy love life. Through her  
constant exposure in the press, she gave the  
public the false impression that she was a major  
movie star. This book charts the captivating life  
and career of Jayne Mansfield. A biography  
overviews her rise to fame, her three marriages  
and five children, and her death in a grisly  
automobile accident at an early age. The chapters  
that follow are each devoted to her performances  
in a particular genre, such as film, stage, and  
television. Each chapter contains annotated  
entries for her work in that media, providing cast  
and credit listings, plot summaries, review  
excerpts, and commentary. Appendices list her  
appearances on magazine and record covers, and  
an annotated bibliography discusses additional  
sources of information.

*Handbook of Autobiography / Autofiction* Martina  
Wagner-Egelhaaf 2019-01-29 Autobiographical  
writings have been a major cultural genre from  
antiquity to the present time. General questions of  
the literary as, e.g., the relation between

literature and reality, truth and fiction, the dependency of author, narrator, and figure, or issues of individual and cultural styles etc., can be studied preeminently in the autobiographical genre. Yet, the tradition of life-writing has, in the course of literary history, developed manifold types and forms. Especially in the globalized age, where the media and other technological / cultural factors contribute to a rapid transformation of lifestyles, autobiographical writing has maintained, even enhanced, its popularity and importance. By conceiving autobiography in a wide sense that includes memoirs, diaries, self-portraits and autofiction as well as media transformations of the genre, this three-volume handbook offers a comprehensive survey of theoretical approaches, systematic aspects, and historical developments in an international and interdisciplinary perspective. While autobiography is usually considered to be a European tradition, special emphasis is placed on the modes of self-representation in non-Western cultures and on inter- and transcultural perspectives of the genre. The individual contributions are closely interconnected by a system of cross-references. The handbook addresses scholars of cultural and literary studies, students as well as non-academic readers.

**Future Perspectives in Risk Models and**

**Finance** Alain Bensoussan 2014-11-20 This book provides a perspective on a number of approaches to financial modelling and risk management. It examines both theoretical and practical issues. Theoretically, financial risks models are models of a real and a financial "uncertainty", based on both common and private information and economic theories defining the rules that financial markets

comply to. Financial models are thus challenged by their definitions and by a changing financial system fueled by globalization, technology growth, complexity, regulation and the many factors that contribute to rendering financial processes to be continuously questioned and re-assessed. The underlying mathematical foundations of financial risks models provide future guidelines for risk modeling. The book's chapters provide selective insights and developments that can contribute to better understand the complexity of financial modelling and its ability to bridge financial theories and their practice. Future Perspectives in Risk Models and Finance begins with an extensive outline by Alain Bensoussan et al. of GLM estimation techniques combined with proofs of fundamental results. Applications to static and dynamic models provide a unified approach to the estimation of nonlinear risk models. A second section is concerned with the definition of risks and their management. In particular, Guegan and Hassani review a number of risk models definition emphasizing the importance of bi-modal distributions for financial regulation. An additional chapter provides a review of stress testing and their implications. Nassim Taleb and Sandis provide an anti-fragility approach based on "skin in the game". To conclude, Raphael Douady discusses the noncyclical CAR (Capital Adequacy Rule) and their effects of aversion of systemic risks. A third section emphasizes analytic financial modelling approaches and techniques. Tapiero and Vallois provide an overview of mathematical systems and their use in financial modeling. These systems span the fundamental Arrow-Debreu framework underlying financial models of complete markets and subsequently, mathematical systems departing from this framework but yet generalizing their approach to dynamic financial models. Explicitly, models based on fractional calculus, on persistence (short memory) and on entropy-based non-extensiveness. Applications of these models are used to define a modeling approach to incomplete financial models and their potential use as a "measure of incompleteness". Subsequently Bianchi and Pianese provide an extensive overview of multi-fractional models and their important applications to Asset price

modeling. Finally, Tapiero and Jinquyi consider the binomial pricing model by discussing the effects of memory on the pricing of asset prices. International Catalogue of Scientific Literature 1909

**Mathematical Logic for Computer Science**

Paola Spoletini 2020-07-01 In the recent decades mathematical logic has become more and more important in computer science and, in general, in system engineering. In fact, by definition, it is the way of expressing our reasoning in terms of mathematical formalism, thus supplying it with the typical rigor and precision of mathematics. Not by chance, automatic information processing is now pervasive and we find it practically in any human activity and artefact, from embedded, safety-critical systems, to e-commerce, to social networks, etc. Such a pervasiveness and the consequent heterogeneity of the involved systems mandate much more generality in the formalism supporting the engineering activity than traditional specialized models such as, e.g., those for electric circuits and mechanical engines: mathematical logic, paired with computer applications, provides such generality.
