**Abstract Parabolic Evolution Equations and their Applications** Atsushi Yagi,2009-11-03 This monograph is intended to present the fundamentals of the theory of abstract parabolic evolution equations and to show how to apply to various nonlinear diffusion equations and systems arising in science. The theory gives us a unified and systematic treatment for concrete nonlinear diffusion models. Three main approaches are known to the abstract parabolic evolution equations, namely, the semigroup methods, the variational methods, and the methods of using operational equations. In order to keep the volume of the monograph in reasonable length, we will focus on the semigroup methods. For other two approaches, see the related references in Bibliography. The semigroup methods, which go back to the invention of the analytic semigroups in the middle of the last century, are

characterized by precise formulas representing the solutions of the Cauchy problem for evolution equations. The  $t \mapsto e^{tA}$  analytic semigroup generated by a linear operator  $A$  provides directly a fundamental solution to the Cauchy problem for an autonomous linear evolution equation,  $u'(t) = Au(t), u(0) = F$
