*New Trends in Optimal Filtering and Control for  
Polynomial and Time-Delay Systems* Michael

Basin,2008-09-23 0. 1 Introduction Although the general  
optimal solution of the filtering problem for nonlinear state  
and observation equations confused with white Gaussian  
noises is given by the Kushner equation for the conditional  
density of an unobserved state with respect to obser- tions  
(see [48] or [41], Theorem 6. 5, formula (6. 79) or [70],  
Subsection 5. 10. 5, formula (5. 10. 23)), there are a very  
few known examples of nonlinear systems where the Ku-  
ner equation can be reduced to a finite-dimensional closed  
system of filtering eq- tions for a certain number of lower  
conditional moments. The most famous result, the Kalman-  
Bucy filter [42], is related to the case of linear state and  
observation equations, where only two moments, the  
estimate itself and its variance, form a closed system of

filtering equations. However, the optimal nonlinear finite-dimensional filter can be obtained in some other cases, if, for example, the state vector can take only a finite number of admissible states [91] or if the observation equation is linear and the drift term in the state equation satisfies the Riccati equation  $df/dx + f = x$  (see [15]). The complete classification of the “general situation” cases (this means that there are no special assumptions on the structure of state and observation equations and the initial conditions), where the optimal nonlinear finite-dimensional filter exists, is given in [95].
