Model Study of the Response of Silo-type Structures in Dry Sand Under One-dimensional Plane Wave Loading Edward Belk Perry, 1973 Froude modeling, where strength and modulus properties and surface overpressure scale as the length scale, is a potential method for determining the structural response of underground protective structures at overpressures in excess of existing laboratory devices provided the strength and modulus properties can be adequately scaled. The results of this study indicated that Froude model tests on silo-type structures in dry sand under one-dimensional plane wave loading could predict the loading response of a prototype constructed using a length scale of three. The primary contribution of this study was to focus attention on the necessity of scaling the unloading soil moduli if Froude modeling is to successfully predict the time-history of a soil-structure system whenever the characteristics of the problem (loading, geometry, etc.) are such that unloading occurs in the soil.

Transition Temperatures and Related Properties of Three-Ring-Systems with Two Bridging Groups V. Vill,1995-03-06 Volume IV/7 Liquid Crystals is devoted to critically selected and assessed fundamental data, mainly transition temperatures, which characterize the existing liquid crystalline phases and states of a large number of compounds. All relevant references including the very important patent literature and data (1850-1994) were collected in the data base LIQCRYST, from which the present Volume IV/7 has been derived by an individual critical choice of compounds, references and data. The printed tables offer an overall picture of the liquid crystalline field. Furthermore the comparison of corresponding data and perhaps the elucidation of structure-function relationships is facilitated, whereas the data base allows a facile access to any substructure and property search.
