**Measure of the Moon** Zdenek Kopal, C.L. Goudas, 2012-12-06 After many decades spent in astronomical semi-obscurity, the Moon has of late suddenly emerged to claim renewed interest on the part of the students of astronomy, as well as of other branches of physical science and technology; and the reasons which brought this about are indeed of historical significance. From time immemorial, astronomy has been debarred from the status of a genuine experimental science by the utter remoteness of the objects of its study. With the exception of meteors - those small freaks of cosmic matter intercepted by the Earth on its perpetual journey through space - the properties of all celestial bodies outside the gravitational confines of our planet could be studied only at a distance: namely, from the effect of attraction exerted by their masses; or from the ciphered message of their light brought to us by nimble-footed photons across the intervening gaps of space. A dramatic emergence of long-range rockets in the last decade bids fair to bring about a profound change in this situation. On September 13, 1959 - a memorable date in the history of human endeavour - a man-made missile of Russian origin crash landed on the surface of the Moon in the region of its Mare Imbrium, and thus ended the age-long separation of the Earth and its only natural satellite which lasted not less than 4t billion years.

**Photographic Atlas of the Moon** S. M. Chong, Albert Lim, P. S. Ang, 2002-07-25

Day-by-day photographic guide to observing the features of the Moon through a small telescope.

**Moon Observer's Guide** Peter Grego, 2004 A night-by-night guide to studying the moon. The moon is usually the first celestial body that captures a stargazer's attention and imagination. Throughout history, the moon has endured as a universal subject of myth, poems, entertainment and intense scientific endeavor. In clear language and with full color photographs and illustrations throughout, Moon Observer's Guide offers practical guidance to amateur astronomers viewing Earth's only natural satellite. There is valuable advice for observing the Moon with the naked eye, binoculars and telescopes. Central to this book is a detailed 28-day guide to lunar features. Lunar geology and the various causes of physical features, such as craters and volcanoes, are described. Also included are: Guidelines for choosing binoculars and telescopes Ways of recording observations Digital and conventional photography Using Internet resources, personal computers and lunar software programs Safety tips for observing the moon during solar and lunar eclipses Detailed moon maps This book is an ideal reference for the growing numbers of beginning astronomers.

**Introduction to Numerical Programming** Titus A. Beu, 2014-09-03 Makes Numerical Programming More Accessible to a Wider Audience Bearing in mind the evolution of modern programming, most specifically emergent programming languages that reflect modern practice, Numerical Programming: A Practical

Guide for Scientists and Engineers Using Python and C/C++ utilizes the author's many years of practical research and teaching experience to offer a systematic approach to relevant programming concepts. Adopting a practical, broad appeal, this user-friendly book offers guidance to anyone interested in using numerical programming to solve science and engineering problems. Emphasizing methods generally used in physics and engineering—from elementary methods to complex algorithms—it gradually incorporates algorithmic elements with increasing complexity. Develop a Combination of Theoretical Knowledge, Efficient Analysis Skills, and Code Design Know-How The book encourages algorithmic thinking, which is essential to numerical analysis. Establishing the fundamental numerical methods, application numerical behavior and graphical output needed to foster algorithmic reasoning, coding dexterity, and a scientific programming style, it enables readers to successfully navigate relevant algorithms, understand coding design, and develop efficient programming skills. The book incorporates real code, and includes examples and problem sets to assist in hands-on learning. Begins with an overview on approximate numbers and programming in Python and C/C++, followed by discussion of basic sorting and indexing methods, as well as portable graphic functionality Contains methods for function evaluation, solving algebraic and transcendental equations, systems of linear algebraic equations, ordinary differential equations, and eigenvalue problems Addresses approximation of tabulated functions, regression, integration of one- and multi-dimensional

functions by classical and Gaussian quadratures, Monte Carlo integration techniques, generation of random variables, discretization methods for ordinary and partial differential equations, and stability analysis This text introduces platform-independent numerical programming using Python and C/C++, and appeals to advanced undergraduate and graduate students in natural sciences and engineering, researchers involved in scientific computing, and engineers carrying out applicative calculations.

*The Transits of Extrasolar Planets with Moons* David M. Kipping, 2011-08-08 Can we detect the moons of extrasolar planets? For two decades, astronomers have made enormous progress in the detection and characterisation of exoplanetary systems but the identification of an exomoon is notably absent. In this thesis, David Kipping shows how transiting planets may be used to infer the presence of exomoons through deviations in the time and duration of the planetary eclipses. A detailed account of the transit model, potential distortions, and timing techniques is covered before the analytic forms for the timing variations are derived. It is shown that habitable-zone exomoons above 0.2 Earth-masses are detectable with the Kepler space telescope using these new timing techniques.

The Hill-Brown Theory of the Moon's Motion Curtis Wilson, 2010-06-03 This book, in three parts, describes three phases in the development of the modern theory and calculation of the Moon's motion. Part I explains the crisis in lunar theory in the 1870s that led G.W. Hill to lay a new foundation for an

analytic solution, a preliminary orbit he called the variational curve. Part II is devoted to E.W. Brown's completion of the new theory as a series of successive perturbations of Hill's variational curve. Part III describes the revolutionary developments in time-measurement and the determination of Earth-Moon and Earth-planet distances that led to the replacement of the Hill-Brown theory in 1984.

**Logical Aspects of Computational Linguistics. Celebrating 20 Years of LACL (1996–2016)** Maxime Amblard, Philippe de Groote, Sylvain Pogodalla, Christian Retoré, 2016-11-21 Edited under the auspices of the Association of Logic, Language and Information (FoLLI), this book constitutes the refereed proceedings of the 20th anniversary of the International Conference on Logical Aspects of Computational Linguistics, LACL 2016, held in LORIA Nancy, France, in December 2016. The 19 contributed papers, presented together with 4 invited papers and 6 abstracts, were carefully reviewed and selected from 38 submissions. The focus of the conference is the use of type theoretic, proof theoretic, and model theoretic methods for describing and formalising natural language syntax, semantics, and pragmatics as well as the implementation of the corresponding tools.

**Physics and Astronomy of the Moon** Zdeněk Kopal,2013-09-17 Physics and Astronomy of the Moon focuses on the application of principles of physics in the study of the moon, including perturbations, equations, light scattering, and photometry. The selection first offers information on the motion of the moon in space and libration of the moon. Topics include Hill's equations of motion, non-solar perturbations, improved lunar ephemeris, optical and physical libration of the moon, and adjustment of heliometric observations of the moon's libration. The text then elaborates on the dynamics of the earth-moon system, photometry of the moon, and polarization of moonlight. The publication explains lunar eclipses and the topography of the moon. Discussions focus on the photometric model of eclipses, brightness of the solar elementary ring, effects of light scattering, photometry of lunar eclipses, and determination of altitudes on the moon. The text then evaluates the interpretation of lunar craters, luminescence of the lunar surface, and the origin and history of the moon. The selection is a dependable reference for physicists and astronomers interested in the application of principles of

physics in the study of the moon.

**Eudemus of Rhodes** William Fortenbaugh, 2018-01-31 Eudemus of Rhodes was a pupil of Aristotle in the second half of the fourth century BCE. When Aristotle died, having chosen Theophrastus as his successor, Eudemus returned to Rhodes where it appears he founded his own school. His contributions to logic were significant: he took issue with Aristotle concerning the status of the existential is, and together with Theophrastus he made important contributions to hypothetical syllogistic and modal logic. He wrote at length on physics, largely following Aristotle, and took an interest in animal behavior. His histories of geometry, arithmetic, and astronomy were of great importance and are responsible for much of what we know of these subjects in earlier times. Volume 11 in the series Rutgers Studies in Classical Humanities is different in that it is composed entirely of articles that discuss Eudemus from a variety of viewpoints. Sixteen scholars representing seven nations have contributed essays to the volume. A special essay by Dimitri Gutas brings together for the first time the Arabic material relating to Eudemus. Other contributors and essays are: Hans B. Gottschalk, Eudemus and the Peripatos; Tiziano Dorandi, Quale aspetto controverso della biografia di Eudemo di Rodi; William W. Fortenbaugh, Eudemus' Work On Expression; Pamela M. Huby, Did Aristotle Reply to Eudemus and Theophrastus on Some Logical Issues?; Robert Sharples, Eudemus Physics: Change, Place and Time; Han Baltussen, Wehrli's Edition of Eudemus of Rhodes: The Physical Fragments from

Simplicius' Commentary on Aristotle's Physics; Sylvia Berryman, *Sumphues and Suneches: Continuity and Coherence in Early Peripatetic Texts*; István Bodnár, *Eudemos' Unmoved Movers: Fragments 121-123b* Wehrli; Deborah K. W. Modrak, *Phantasia, Thought and Science in Eudemos*; Stephen White, *Eudemos the Naturalist*; Jørgen Mejer, *Eudemos and the History of Science*; Leonid Zhmud, *Eudemos' History of Mathematics*; Alan C. Bowen, *Eudemos' History of Early Greek Astronomy: Two Hypotheses*; Dmitri Panchenko, *Eudemos Fr. 145* Wehrli and *the Ancient Theories of Lunar Light*; and Gábor Betegh, *On Eudemos Fr. 150* Wehrli. [Eudemos of Rhodes] marks a substantial progress in our knowledge of Eudemos. For it enlarges the scope of the information available on this author, highlights the need of, and paves the way to, a new critical edition of the Greek fragments of his works, and provides a clearer view of his life, thought, sources and influence. In all these respects, it represents a necessary complement to Wehrli's edition of Eudemos' fragments. -Amos Bertolacci, *The Classical Bulletin* István Bodnár is a member of the philosophy department at the Eötvös University in Budapest, where he teaches and does research on ancient philosophy. He has been a junior fellow at the Center for Hellenic Studies and most recently has been an Alexander von Humboldt Stipendiat in Berlin at the Max Planck Institut für Wissenschaftsgeschichte and at the Freie Universität. William W. Fortenbaugh is professor of classics at Rutgers University. In addition to editing several books in this series, he has written *Aristotle on Emotion* and *Quellen zur Ethik Theophrastus*. New

is his edition of Theophrastus's treatise On Sweat.

*Returning People to the Moon After Apollo* Pat Norris, 2019-06-04 July 2019 marks 50 years since Neil Armstrong took his famous first steps on the surface of the Moon. As people around the world celebrate the anniversary of this great American achievement, they might wonder why there have been no further human missions to the Moon since Apollo 17 in 1972. This book assesses the legacy of the Apollo missions based on several decades of space developments since the program's end. The question of why we haven't sent humans back to the Moon is explored through a multidisciplinary lens that

weaves together technological and historical perspectives. The nine manned Apollo missions, including the six that landed on the Moon, are described here by an author who has 50 years of experience in the space industry and whose work spanned the Apollo 8–13 missions. The final section of the book provides a comprehensive assessment of today's programs and current plans for sending humans to the Moon.

The Moon Metal Garrett P. Serviss, 2015-11-26 After huge gold deposits were found in Antarctica and gold became common, the world's financial markets went into a tailspin and every currency lost its value. As bankers meet to find a solution they are approached by one Dr. Syx, who has an evil sneer and a source of a new, mysterious metal to replace gold - a metal which only he can produce. It is up to two heroic engineers try to uncover the secret of this new metal...

*Mapping of the Moon* Zdenek Kopal, R.W. Carder, 2013-04-17 The aim of the present book has been to provide an outline - the first of its kind - of the history of the human efforts to map the topography of the surface of our satellite, from the days of pre-telescopic astronomy up to the present. These efforts commenced modestly at the time when the unaided eye was still the only tool at the disposal of men interested in the face of our satellite; and were continued since for more than three centuries by a small band of devoted friends of the Moon in several countries. Many of these were amateur astronomers, and almost all were amateur cartographers; though some highly

skilled in their art. The reader interested in the history of lunar mapping between 1600 and 1960 will find its outline in the first chapter of this book; and can follow the way in which the leadership in the mapping of the Moon, the cradle of which stood in Italy, passed successively to France, Germany, and eventually to the United States. All efforts described in this chapter were wholly superseded by subsequent developments since 1960, largely motivated by logistic needs of a grand effort which culminated with repeated manned landings on the Moon between 1969-1972- a feat which will remain for ever one of the glories of our century.

*A Complete System of Astronomy* Samuel Vince, 1797

An Introduction to the Study of the Moon Zdenek Kopal, 2013-06-29 After several decades spent in astronomical semi-obscurity, the Moon has of late suddenly emerged as an object of considerable interest to students of astronomy as well as of other branches of natural science and technology; and the reasons for this are indeed of historical significance. For the Moon has now been destined to be the first celestial body outside the confines of our own planet to be reconnoitered at a close range by means of spacecraft built and sent out by human hand for this purpose. At the time of writing, not less than ten such spacecraft of American as well as Russian origin landed already on different parts of the lunar surface; and some of these provided remarkable records of its detail structure to a spatial resolution increased thousandfold over that attained so far from our ground-based facilities. A

renewed interest in our satellite, stemming from this source, on the part of the students of many branches of science and technology has also underlined the need for presenting the gist of our present knowledge in this field in the form that could serve as an introduction to the study of the Moon not only for astronomers, but also for serious students from other branches of science or technology.
