WHO Guidelines on Tularemia World Health Organization, 2007-12-15 Tularemia is a bacterial zoonotic disease of the northern hemisphere. The bacterium (*Francisella tularensis*) is highly virulent for humans and a range of animals such as rodents, hares and rabbits. Humans can infect themselves by direct contact with infected animals, by arthropod bites, by ingestion of contaminated water or food, or by inhalation of infective aerosols. There is no human-to-human transmission. In

addition to its natural occurrence *F. tularensis* evokes great concern as a potential bioterrorism agent. *F. tularensis* subspecies *tularensis* is one of the most infectious pathogens known in human medicine. In order to avoid laboratory-associated infection safety measures are needed and consequently clinical laboratories do not generally accept specimens for culture. However since clinical management of cases depends on early recognition there is an urgent need for diagnostic services. This first edition of WHO Guidelines on tularaemia provides background information on the disease describes the current best practices for its diagnosis and treatments in humans suggests measures to be taken in case of epidemics and provides guidance on how to handle *F. tularensis* in the laboratory. The target audience includes clinicians laboratory personnel public health workers veterinarians and any other person with an interest in zoonoses.

New Frontiers of Molecular Epidemiology of Infectious Diseases Serge Morand,François Beaudreau,Jacques Cabaret,2011-09-08 Molecular epidemiology has recently broaden its focuses due to the development of molecular tools but also by incorporating advances of other fields such as

mathematical epidemiology, molecular ecology, population genetics and evolution. Facing new risks of emerging and re-emerging infectious diseases that are threats for humans and their livestock, the objectives of molecular epidemiology include: - the development of molecular tools, genotyping and gene expression - the incorporation of concepts and results of population genetics of infectious diseases - the integration of recent advances in theoretical epidemiology and evolutionary ecology of diseases - a better understanding of transmission for the development of risk factors analyses. This book will demonstrate how the latest developments in molecular tools and in epidemiology can be integrated with studies of host-pathogen interactions. Besides a strong theoretical component, there will also be an emphasis on applications in the fields of epidemiology, public health, veterinary medicine, and health ecology. Students and researchers in the fields of epidemiology, animal and human health, evolutionary ecology, parasitology are the main potential readers of the book, as well as a broader audience from veterinary medicine and conservation.
