Are you looking to learn web design the right way? Not by using an off-the-shelf software package, but by creating customized sites in a way that gives you full control? This guide provides that ability even if you have no previous coding skills or experience. One of the critical challenges of modern web design is being able to write for the mobile web to reach those increasingly mobile-connected users. How to Design and Write Web Pages Today addresses this key objective while also explaining how to deliver improved experiences for users of desktop-style devices based on the constraints and challenges of mobile design. This user-friendly tutorial begins with background information to enable a better understanding of the web and its purpose and function as well as how to generate material for a website. Readers then learn about the three overarching concerns in the short- and long-term viability and usefulness of websites: accessibility, usability, and sustainability. Key technologies and techniques for web design—such as the HTML and CSS languages to the conceptual foundations of grid-based design—are next, followed by a thorough explanation of how to publish a site on the open web, from creating a viable site architecture to automating the publishing of content to the open web.

*Non-Volatile Memory Database Management Systems* Joy Arulraj,Andrew Pavlo,2022-06-01 This book explores the implications of non-volatile memory (NVM) for database management systems (DBMSs). The advent of NVM will fundamentally change the dichotomy between volatile memory and durable storage in DBMSs. These new NVM devices are almost as fast as volatile memory, but all writes to them are persistent even after power loss. Existing DBMSs are unable to take full advantage of this technology because their internal architectures are predicated on the assumption that memory is volatile. With NVM, many of the components of legacy DBMSs are unnecessary and will degrade the performance of data-intensive applications. We present the design and implementation of DBMS architectures that are explicitly tailored for NVM. The book focuses on three aspects of

a DBMS: (1) logging and recovery, (2) storage and buffer management, and (3) indexing. First, we present a logging and recovery protocol that enables the DBMS to support near-instantaneous recovery. Second, we propose a storage engine architecture and buffer management policy that leverages the durability and byte-addressability properties of NVM to reduce data duplication and data migration. Third, the book presents the design of a range index tailored for NVM that is latch-free yet simple to implement. All together, the work described in this book illustrates that rethinking the fundamental algorithms and data structures employed in a DBMS for NVM improves performance and availability, reduces operational cost, and simplifies software development.

There is straightforward performance optimization that can be performed with a minimum of effort and without extensive previous experience or in-depth knowledge. The POWER8 processor contains many new and important performance features, such as support for eight hardware threads in each core and support for transactional memory. The POWER8 processor is a strict superset of the IBM POWER7+™ processor, and so all of the performance features of the POWER7+ processor, such as multiple page sizes, also appear in the POWER8 processor. Much of the technical information and guidance for optimizing performance on POWER8 processors that is presented in this guide also applies to POWER7+ and earlier processors, except where the guide explicitly indicates that a feature is new in the POWER8 processor. This guide strives to focus on optimizations that tend to be positive across a broad set of IBM POWER® processor chips and systems. Specific guidance is given for the POWER8 processor; however, the general guidance is applicable to the IBM POWER7+, IBM POWER7®, IBM POWER6®, IBM POWER5, and even to earlier processors. This guide is directed at personnel who are responsible for performing migration and implementation activities on POWER8 processor-based systems. This includes system administrators, system architects, network administrators, information architects, and database administrators (DBAs).
