Building Secure Software John Viega, Gary McGraw, 2002

Climate Change, Policy and Security Donald Wallace, Daniel Silander, 2018-04-17 This book examines the multiple strategies proposed by the international community for addressing global climate change (GCC) from both human and state-security perspectives. It examines what is needed from major states working within the UN framework to engage with the multiple dimensions of a strategy that addresses GCC and its impacts, where such engagement promotes both human and state security. Two broad frameworks for approaching these issues provide the basis of discussion for the individual chapters, which discuss the strategies being undertaken by major state powers (the US, the EU, China, India, Japan, and Russia). The first framework considers the multiple strategies, mitigation, adaptation, and capacity-building required of the international community to address the effects of GCC. The second framework considers the differentiation of GCC policies in terms of security and how the efficacy of these strategies could be impacted by whether priority is given to state security over human security concerns. This book will be of much interest to students of human security, climate change, foreign policy, and International Relations.

Cybersecurity Ethics Mary Manjikian, 2017-10-25 This new textbook offers an accessible introduction to the topic of cybersecurity ethics. The book is split into three parts. Part I provides an introduction to the field of ethics, philosophy and philosophy of science, three ethical frameworks - virtue ethics, utilitarian ethics and communitarian ethics - and the notion of ethical hacking. Part II applies these frameworks to particular issues within the field of cybersecurity, including privacy rights, intellectual property and piracy, surveillance, and cyberethics in relation to military affairs. The third part concludes by exploring current codes of ethics used in cybersecurity. The overall aims of the book are to: provide ethical frameworks to aid decision making; present the key ethical issues in relation to computer security; highlight the connection between values and beliefs and the professional code of ethics. The textbook also includes three different features to aid students:

'Going Deeper' provides background information on key individuals and concepts; 'Critical Issues' features contemporary case studies; and 'Applications' examine specific technologies or practices which raise ethical issues. Computer Security Dieter Gollmann, 1999-03-02 A comprehensive and practical text and the perfect starting point for this subject ... 'Is this system secure?' seems, on the face of it, a straightforward question. Yet how one arrives at an answer is a process which poses a wide range of more complex questions which require a basic understanding of security mechanisms. Questions, such as: * Should protection focus on data, operations or users? * Whilst taking cast iron measures to build in security at one level, what does one do to prevent attackers gaining entry from a lower level? Starting with basic definitions and concepts, the first section of the book goes on to outline the mechanisms located at the heart of the computer system, mechanisms which provide the basis for techniques used in all other branches of the system. The second section examines the security features found in operating systems such as UNIX and Windows NT, catalogues security breaches, and introduces the topic of security evaluation. A third section is devoted to issues associated with distributed systems, such as network - and Web - security and considers cryptography as an essential technique for such environments. The final section of the book is constructed around database security, discussing problems in multi-level security, and examining security problems in specific settings. Written for self-study and course use, this book will suit a variety of introductory and more advanced security programmes for students of computer science, engineering and related disciplines. It meets a real need for a comprehensive textbook on the subject. Technical and project managers will also find that the broad coverage offers a great starting point for discovering underlying issues and provides a means of orientation in a world populated by a bewildering array of competing security systems.

Benchmarking Telemedicine: Improving Health Security in the Balkans C.S. Stone, 2017-10-25 Health security is dependent on many factors such as: individual government policies and regulations; budgets; management systems; and the collection, analysis, use, and protection of data. Telemedicine has the potential to change how healthcare is delivered around the world, and has

developed to the point where it is possible for its use to become commonplace. The questions are, however, whether and how the use of telemedicine will improve health security in Southeast Europe. This book presents papers from the NATO Advanced Research Workshop (ARW) on Benchmarking Telemedicine: Improving Health Security in the Balkans, held in Skopje, Macedonia, in November 2016. The aim of the workshop was to bring together people from a wide range of sectors within the telemedicine community with representatives of NATO Member and Partner countries to share information and develop solutions to health security issues. Participants addressed issues such as cyber security for the implementation of telemedicine; healthcare capabilities of deployed and local medical equipment; learning methods; information sharing among local professionals; prevention and control of infectious diseases; best practices of telemedicine among NATO Member and Partner countries; integration of telemedicine across regions and borders; and telemedicine implementation. The book will be of interest to all those wishing to gain a better insight into the implications of telemedicine for health security.

This book sounds an alarm: after decades of being lulled into complacency by narratives of technological utopianism and neutrality, people are waking up to the large-scale consequences of Silicon Valley-led technophilia. This book trains a spotlight on the inequality, marginalization, and biases in our technological systems, showing how they are not just minor bugs to be patched, but part and parcel of ideas that assume technology can fix--and control--society. Contributors Janet Abbate, Ben Allen, Paul N. Edwards, Nathan Ensmenger, Mar Hicks, Halcyon M. Lawrence, Thomas S. Mullaney, Safiya Umoja Noble, Benjamin Peters, Kavita Philip, Sarah T.
